Java 8 Install on Windows

Installing Java 8 on Windows

To avoid having to download java-8 directory from oracle (which requires creating an account on their platform), please check out this youtube video. I belive that the link you want to grab the files from (as described in this video) is here.

Alternatively, if you don't want to deal with this, you can alwasy go here and download the Windows x64 installer (please come see me if you have a 32bit machine: it is **extremely** unlikely that you do). I am terribly sorry but you will need to create a oracle account to download this.
